Today's project!

Guess Who?

What is Guess Who?

- Fun Board Game
- We're going to code our own version
- Computer picks a character
- You ask questions to figure out who it is

What is Guess Who?

Q: Do they have a hat?

A: YES

Eliminates everyone without a hat

Keep asking questions until figure out who it is

Introduction to Edstem

Log on

Signing up to Edstem

Log in if you already have a an “Edstem” account from a past GPN

Already have an account? [Log in](#)

If you haven't got an account, let's make one:

1. Type in your Full Name
2. Type in your personal email
3. Click Create Account
4. Go to your email and verify your new account
5. Create a password

Full name

Email

you@girlsprogramming.network

[Create account](#)

Click Join Course

[Join course](#)

The name of your course will be at the top :

[Guess Who G](#)

If you don't have access to your email account, ask a tutor for a GPN Edstem login

Getting to the lessons

1. Once you are in the course, you'll be taken to a discussion page.
2. Click the button for the lessons page (top right - looks like a book)

The set up of the workbook

The main page:

1. Heading at the top that tells you the project you are in
2. List of “Chapters” called something like **1:Welcome Message**
They have an icon that looks like this:
3. To complete your project, work through the chapters one at a time

- 1: Welcome message

- 2: The first word

- 3: What comes next?

Inside a Chapter

Inside a Chapter there are two main types of pages:

- **Lessons** where you will do your coding.
 - They have this icon:

- **Checkpoints**

Checkpoint

Each chapter has a checkpoint to complete to move to the next chapter. Make sure you scroll down to see all the questions in a checkpoint.

There may also be **Bonus Lessons** to try if you want to or if you are waiting for the next lecture

☰ 1: Welcome message

1.1 Print a message

Checkpoint

How to do the work

In each Lesson there is:

1. A section on the left with instructions
2. A section on the right for your code

You will need to **copy your code from the last lesson**, then follow the instructions to change your code

The screenshot shows a lesson interface. On the left, under a 'Description' tab, is the section '1.1 Print a message'. Below the title is a yellow warning box with a triangle icon containing an exclamation mark, with the text: 'You should wait for the Intro to Python lecture before you start this module'. Below the warning box, the text reads: 'We want to print a message to tell the user what our program does.' followed by a numbered list: '1. At the top of your code, use the print statement to display the following message: "I am a markov chain generator"'. At the bottom of the instructions, it says: 'Now run your program to see what happens!'. On the right, a code editor window titled 'markov_chains.py' is open, showing a single line of code: '1 # Start your code here'.

There are also Hints and Code Blocks to help you

Hints

Sometimes in a lesson, there's some code we want you to do that might be a bit tricky, to help you out we've added some hints. They look like this:

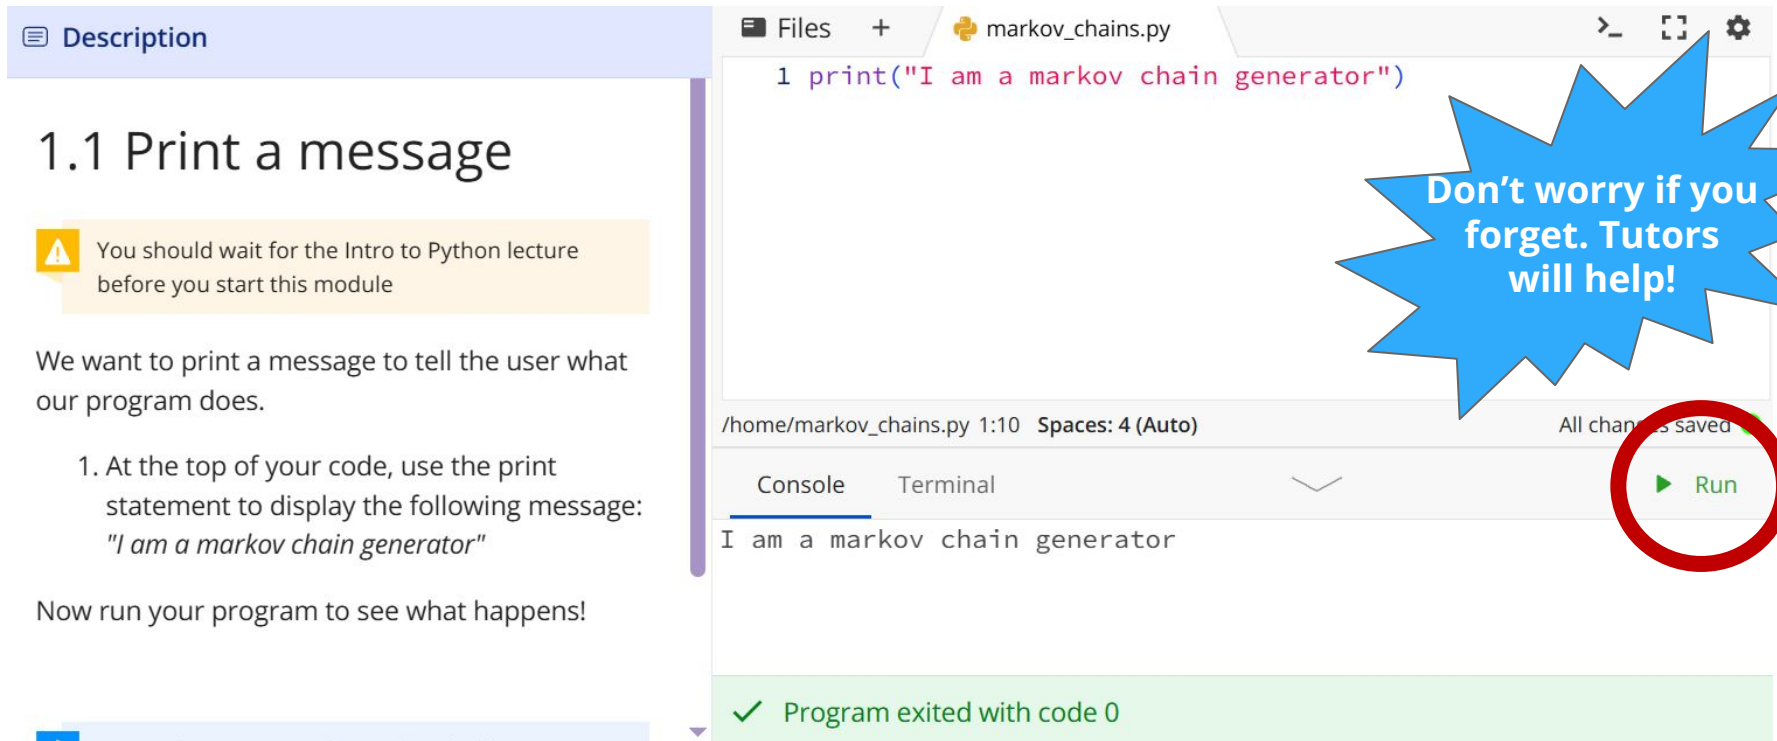

If you press the blue run button it will show you what that code does, you can even change the code to see if/how it changes.

These are **just hints** make sure you're not copying the hint into your code as it will likely end up breaking. They are just to show you the kinds of things you can do.

Running your code...

Click  in the bottom right hand corner
Your code will run and any output will display in the Console

The screenshot shows a code editor interface. On the left, there is a 'Description' panel with the following content:

1.1 Print a message

 You should wait for the Intro to Python lecture before you start this module

We want to print a message to tell the user what our program does.

1. At the top of your code, use the print statement to display the following message:
"I am a markov chain generator"

Now run your program to see what happens!

On the right, the code editor shows a file named 'markov_chains.py' with the following code:

```
1 print("I am a markov chain generator")
```

Below the code editor is a console window showing the output: "I am a markov chain generator". At the bottom of the console, a green message indicates: "Program exited with code 0".

A blue starburst callout on the right side of the code editor says: "Don't worry if you forget. Tutors will help!". A red circle highlights the green 'Run' button in the bottom right corner of the code editor.

Some shortcuts...

There are a couple things you can do to make copying your code from one page to another easier.

- 1. Ctrl + A** Pressing these keys together will select all the text on a page
- 2. Ctrl + C** Pressing these keys together will copy anything that's selected
- 3. Ctrl + V** Pressing these keys together will paste anything you've copied

On Macs use Command (⌘) instead of Ctrl

Project time!

You now know all about the EdStem!

You should now sign up and join our EdStem class if you haven't done this already.

Remember the tutors will be around to help!

Intro to Programming

What is programming?

Programming is not a bunch of crazy numbers!

It's giving computers a set of instructions!

A Special Language

A language to talk to dogs!

Programming is a language to talk to computers

People are smart! Computers are dumb!

SALAD INSTRUCTIONS

Programming is like a recipe!

Computers do EXACTLY what you say, every time.

Which is great if you give them a good recipe!

1) GET A LETTUCE HEAD, A CARROT, A TOMATO, A KNIFE, AND A BOWL

2) USE THE KNIFE TO CUT UP THE LETTUCE HEAD, CARROT, AND TOMATO

3) PUT THE LETTUCE, CARROT AND TOMATO IN THE BOWL

4) MIX THE CONTENTS OF THE BOWL

People are smart! Computers are dumb!

But if you get it out of order....

A computer wouldn't know this recipe was wrong!

SALAD INSTRUCTIONS

1) GET A LETTUCE HEAD, A CARROT, A TOMATO, A KNIFE, AND A BOWL

3) PUT THE LETTUCE, CARROT AND TOMATO IN THE BOWL

2) USE THE KNIFE TO CUT UP THE LETTUCE HEAD, CARROT, AND TOMATO

4) MIX THE CONTENTS OF THE BOWL

People are smart! Computers are dumb!

SALAD INSTRUCTIONS

Computers are bad at filling in the gaps!

A computer wouldn't know something was missing, it would just freak out!

Everyone/thing has strengths!

- Understand instructions despite:
 - Spelling mistakes
 - Typos
 - Confusing parts
- Solve problems
- Tell computers what to do
- Get smarter every day

- Does exactly what you tell it
- Does it the same every time
- Doesn't need to sleep!
- Will work for hours on end!
- Get smarter when you tell them how

Intro to Python

Let's get coding!

Let's make a mistake!

Click on Chapter 1 **Welcome to "Guess Who"**

The **Playground** Lesson will open.

It looks like this

Guess Who

< Lessons ↗ Prev Next

Playground

★ Challenge ⌚ Submissions ⋮

Discussion is set to read only

☰ 1. Welcome to "Guess Who"

🔍 Description

Playground

You can use this slide to test any code you want!!!

We've given you full access to the terminal for your own testing. To run you just have to hit the green run button!

Files + guess_who.py

```
1
```

/home/guess_who.py 1:3 Spaces: 4 (Auto) All changes saved ●

Console ▶ Run

Let's make a mistake!

Description

Playground

You can use this slide to test any code you want!!!

We've given you full access to the terminal for your own testing. To run you just have to hit the green run button!

```
Files + guess_who.py  
1 vdfhvdsxnbjhksdvkjh
```

/home/guess_who.py 1:20 Spaces: 4 (Auto) All changes saved

Console ▶ Run

Type by **button mashing** the keyboard here - type anything you want

Click Run here to run your code!

Did you get a big ugly error message?

Console ▶ Run

```
File "/home/guess_who.py", line 1, in <module>  
    vdfhvdsxnbjhksdvkjh  
NameError: name 'vdfhvdsxnbjhksdvkjh' is not defined
```

Mistakes are great!

*SyntaxError:
Invalid Syntax*

Good work you made an error!

*ImportError:
No module
named humour*

- Programmers make A LOT of errors!
- Errors give us hints to find mistakes
- Run your code often to get the hints!!
- Mistakes won't break computers!

*AttributeError:
'NoneType' object
has no attribute
'foo'*

*TypeError: Can't
convert 'int' object
to str implicitly*

*KeyError:
'Hairy Potter'*

We can learn from our mistakes!

Error messages help us fix our mistakes!

We read error messages from bottom to top

3. Where that code is

Traceback (most recent call last):

```
File "C:/Users/Madeleine/Desktop/tmp.py", line 9, in <module>  
    print("I have " + 5 + " apples")
```

```
TypeError: can only concatenate str (not "int") to str
```

1. What went wrong

2. What code didn't work

Adding a comment!

Sometimes we want to write things in our file that the computer doesn't look at. We can use **comments** for that!

Sometimes we want to write a note for a people to read

```
# This code was written by Vivian
```

And sometimes we want to not run some code (but don't want to delete it!)

```
# print("Goodbye world!")
```

Write some code!!

This is the first bit of code we will do. What do you think it does?

```
print("hello world")
```

Write some code!!

This is the first bit of code we will do. What do you think it does?

```
print("hello world")
```

It prints the words "hello world" onto the screen!

Your turn!

1. Type the following into the code window (make sure you include the quotes (") at the start and end)
2. Run the code by clicking Run

```
print("hello world")
```

Did it print the text:

```
hello world
```

Try printing something different - don't forget the quotes

Tell me more!

We can `print` things in lots of different ways in python!

```
>>> print("Hello world!")
```

```
>>> print("Hello", "world!")
```

```
>>> print("Hello" + "world")
```

Tell me more!

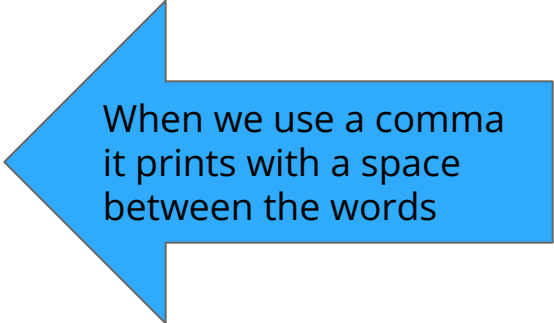

We can `print` things in lots of different ways in python!

```
>>> print("Hello world!")
```

```
Hello world!
```

```
>>> print("Hello", "world!")
```

```
>>> print("Hello" + "world")
```

When we use a comma
it prints with a space
between the words

Tell me more!

We can `print` things in lots of different ways in python!

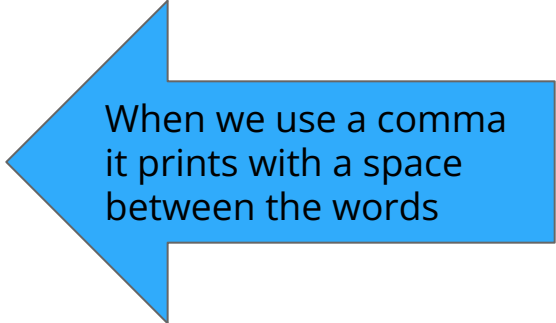

```
>>> print("Hello world!")
```

```
Hello world!
```

```
>>> print("Hello", "world!")
```

```
Hello world!
```

```
>>> print("Hello" + "world")
```

When we use a comma
it prints with a space
between the words

Tell me more!

We can `print` things in lots of different ways in python!

```
>>> print("Hello world!")
```

```
Hello world!
```

```
>>> print("Hello", "world!")
```

```
Hello world!
```

```
>>> print("Hello" + "world")
```

When we use a + it just adds the words together - no spaces

Tell me more!

We can `print` things in lots of different ways in python!

```
>>> print("Hello world!")
```

```
Hello world!
```

```
>>> print("Hello", "world!")
```

```
Hello world!
```

```
>>> print("Hello" + "world")
```

```
Hello world!
```

When we use a + it just adds the words together - no spaces

Variables

Variables are useful for storing things that change

(i.e. things that "vary" - hence the word "variable")

You can think of it like putting information in a box and giving it a label

Variables

When coding, we can make a variable called **friend** and set it to a value like this

```
friend = "Alex"
```

Variables

Instead of writing the word “Alex”, we can write **friend** (the variable’s name).

The computer will substitute the current value of the variable.

It’s like we’re getting the value out of the box!

```
print(friend)
```

Variables

Instead of writing the word “Alex”, we can write **friend** (the variable’s name).

The computer will substitute the current value of the variable.

It’s like we’re getting the value out of the box!

```
print(friend)
```

Alex

Reusing variables

We can replace values in variables:

```
animal = "dog"  
print("My favourite animal is a " + animal)  
animal = "cat"  
print("My favourite animal is a " + animal)  
animal = animal + "dog"  
print("My favourite animal is a " + animal)
```

What will this output?

Reusing variables

We can replace values in variables:

```
animal = "dog"
print("My favourite animal is a " + animal)
animal = "cat"
print("My favourite animal is a " + animal)
animal = animal + "dog"
print("My favourite animal is a " + animal)
```

What will this output? `My favourite animal is a dog`

Reusing variables

We can replace values in variables:

```
animal = "dog"  
print("My favourite animal is a " + animal)  
animal = "cat"  
print("My favourite animal is a " + animal)  
animal = animal + "dog"  
print("My favourite animal is a " + animal)
```

What will this output? `My favourite animal is a dog`
`My favourite animal is a cat`

Reusing variables

We can replace values in variables:

```
animal = "dog"  
print("My favourite animal is a " + animal)  
animal = "cat"  
print("My favourite animal is a " + animal)  
animal = animal + "dog"  
print("My favourite animal is a " + animal)
```

What will this output? `My favourite animal is a dog`
`My favourite animal is a cat`
`My favourite animal is a catdog`

Asking a question!

It's more fun when we get to interact with the computer!

We can write code to get the computer to ask us a question!

We use **input** and it looks like this:

```
my_name = input('What is your name? ')
```

Asking a question!

```
my_name = input("What is your name? ")  
print("Hello " + my_name)
```

This is what happens ...

1. Computer prints what's in quotes after `input`
2. Computer waits for someone to type in a response
3. Computer stores response in variable called `my_name`
4. Computer prints 'Hello' and whatever is in the variable `my_name`

```
What is your name? Maddie
```

```
Hello Maddie
```

Asking a question!

Store the answer
in the variable
my_name

Writing input tells
the computer to
wait for a response

This is the question
you want printed to
the screen

```
my_name = input("What is your name? ")  
print("Hello " + my_name)
```

What do you think happens?

What is your name? Maddie

Hello Maddie

We can use the answer
the user wrote that we
then stored later!

Asking a question!

Big Tip : Put a space at the end of the question so it won't be squished together with your answer - it looks nicer!

```
my_name = input("What is your name? ")  
print("Hello " + my_name)
```

SPACE 😊

```
What is your name? Maddie  
Hello Maddie
```

NO SPACE 😞

```
What is your name?Maddie  
Hello Maddie
```

Project time!

You now know all about printing, variables and input!

Let's put what we learnt into our project

Try to do Part 1

Don't forget to copy your code when you move to a new Lesson!

The tutors will be around to help!

Lists

Storing groups of things in variables

- We know how to store individual things, but what if we have a group of things?
- We can try to do this with variables

```
>>> day1 = 'Monday'
>>> day2 = 'Tuesday'
>>> day3 = 'Wednesday'
>>> day4 = 'Thursday'
>>> day5 = 'Friday'
>>> day6 = 'Saturday'
>>> day7 = 'Sunday'
```
- But this can get long and hard to deal with *really* quickly...

Lists can store multiple things

- It's better to create a **list**
- A **list** is an ordered group of related items, all in the same variable
- So instead of using 7 variables to store the days, we can use one:

```
>>> days = [ 'Monday', 'Tuesday',  
             'Wednesday', 'Thursday', 'Friday',  
             'Saturday', 'Sunday' ]
```

Creating lists

- A **list** is created using square brackets in Python
- An example

```
>>> words = ['This', 'is', 'a', 'sentence']
```
- Think of your four favourite things.....what are they?
- How could we store them in a list?

Your Favourite Things!

Stored in the variable favourites

Made up of different items (these are strings)

The items are separated by commas

```
favourites=['books', 'chocolate', 'butterfly', 'skateboard']
```

Has square brackets

Accessing Lists!

```
favourites=['books', 'chocolate', 'butterfly', 'skateboard']
```

- The favourites **list** holds four words in order.
- We can count out the items using index numbers!

0

1

2

3

- **Indices start from zero!**

Accessing Lists

- We access the items in a **list** using an index in square brackets

```
                [0]          [1]          [2]          [3]  
favourites=[ 'books', 'chocolate', 'butterfly', 'skateboard' ]
```

```
>>> favourites[0]
```

```
'books'
```

```
>>> favourites[1]
```

```
'chocolate'
```

- What code do you need to access the **3rd** item in the list?

Accessing Lists

- We access the items in a **list** using an index in square brackets

```
                [0]          [1]          [2]          [3]  
favourites=[ 'books', 'chocolate', 'butterfly', 'skateboard' ]
```

```
>>> favourites[0]
```

```
'books'
```

```
>>> favourites[1]
```

```
'chocolate'
```

- What code do you need to access the **3rd** item in the list?

```
>>> favourites[2]
```

```
'butterfly'
```

Falling off the edge

- Python complains if you try to go past the end of a `list`

```
>>> favourites = ['books', 'chocolate',  
'butterfly', 'skateboard']  
>>> favourites[4]
```

```
Traceback (most recent call last):  
  File "<stdin>", line 1, in <module>  
IndexError: list index out of range
```

List of lists!

You can put anything in a list, even more lists!

We could use a list of lists to store tennis partners.!

```
tennis_pairs = [ ["Alex", "Emily"], ["Kass",  
"Annie"], ["Amara", "Viv"] ]
```

Project time!

Now you know all about lists!

Let's put what we learnt into our project
Try to do Part 2

The tutors will be around to help!

If Statements

Conditions!

Conditions let us make decisions.

First we test if the condition is met!

Then maybe we'll do the thing

If it's raining take an umbrella

Yep it's raining

..... take an umbrella

Booleans (True and False)

computers store whether a condition is met in the form of

True and **False**

To figure out if something is **True** or **False** we do a comparison

`5 < 10`

`3 + 2 == 5`

`5 != 5`

`"Dog" == "dog"`

`"D" in "Dog"`

`"Q" not in "Cat"`

Booleans (True and False)

computers store whether a condition is met in the form of

True and **False**

To figure out if something is **True** or **False** we do a comparison

<code>5 < 10</code>	<code>True</code>	<code>"Dog" == "dog"</code>
<code>3 + 2 == 5</code>		<code>"D" in "Dog"</code>
<code>5 != 5</code>		<code>"Q" not in "Cat"</code>

Booleans (True and False)

computers store whether a condition is met in the form of

True and **False**

To figure out if something is **True** or **False** we do a comparison

<code>5 < 10</code>	<code>True</code>	<code>"Dog" == "dog"</code>
<code>3 + 2 == 5</code>	<code>True</code>	<code>"D" in "Dog"</code>
<code>5 != 5</code>		<code>"Q" not in "Cat"</code>

Booleans (True and False)

computers store whether a condition is met in the form of

True and **False**

To figure out if something is **True** or **False** we do a comparison

<code>5 < 10</code>	<code>True</code>	<code>"Dog" == "dog"</code>
<code>3 + 2 == 5</code>	<code>True</code>	<code>"D" in "Dog"</code>
<code>5 != 5</code>	<code>False</code>	<code>"Q" not in "Cat"</code>

<code>5 != 5</code>	<code>False</code>	<code>"Q" not in "Cat"</code>	<code>True</code>

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

That's the
condition!

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

That's the
condition!

Is it **True** that fave_num is less than 10?

- Well, fave_num is 5
- And it's **True** that 5 is less than 10
- So it is **True**!

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if True:
    print("that's a small number")
```

Put in the answer to the question

Is it **True** that fave_num is less than 10?

- Well, fave_num is 5
- And it's **True** that 5 is less than 10
- So it is **True**!

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if True:
    print("that's a small number")
```

What do you think happens?

```
>>>
```

Conditions

So to know whether to do something, they find out if it's **True**!

```
fave_num = 5
if True:
    print("that's a small number")
```

What do you think happens?

```
>>> that's a small number
```

Conditions

How about a different number???

```
fave_num = 9000  
if fave_num < 10:  
    print("that's a small number")
```

Conditions

Find out if it's **True**!

```
fave_num = 9000
if False:
    print("that's a small number")
```

Put in the answer to the question

Is it **True** that fave_num is less than 10?

- Well, fave_num is 9000
- And it's not **True** that 9000 is less than 10
- So it is **False**!

Conditions

How about a different number???

```
fave_num = 9000  
if fave_num < 10:  
    print("that's a small number")
```

What do you think happens?

```
>>>
```

Conditions

How about a different number???

```
fave_num = 9000  
if fave_num < 10:  
    print("that's a small number")
```

What do you think happens?

```
>>>
```

Nothing!

If statements

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
```

This line ...

... controls this line

If statements

Actually

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
    print("and I like that")
    print("A LOT!!")
```

This line ...

... controls anything below it
that is indented like this!

If statements

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
    print("and I like that")
    print("A LOT!!")
```

What do you think happens?

>>>

If statements

```
fave_num = 5
if fave_num < 10:
    print("that's a small number")
    print("and I like that")
    print("A LOT!!")
```

```
>>> that's a small number
>>> and I like that
>>> A LOT!!
```

If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

If statements

```
word = "GPN"  
if word == "GPN":  
    print("GPN is awesome!")
```

What happens?

```
>>> GPN is awesome!
```

Else statements

else
statements
means something
still happens if
the **if** statement
was **False**

```
word = "Chocolate"  
if word == "GPN":  
    print("GPN is awesome!")  
else:  
    print("The word isn't GPN :(")
```

What happens?

Else statements

else
statements
means something
still happens if
the **if** statement
was **False**

```
word = "Chocolate"  
if word == "GPN":  
    print("GPN is awesome!")  
else:  
    print("The word isn't GPN :(")
```

What happens?

```
>>> The word isn't GPN :(
```

Else statements

```
word = "Chocolate"
if word == "GPN":
    print("GPN is awesome!")
else:
    print("The word isn't GPN :(")
```

Remember ...

==

When testing for equals in
your condition

:

At end of each if line to say you have
finished writing your condition

Project Time!

You now know all about **if** and **else**!

Let's put what we learnt into our project
Try to do Parts 3 and 4

The tutors will be around to help!

Random!

That's so random!

There's lots of things in life that are up to chance or random!

Python lets us **import** common bits of code people use! We're going to use the **random** module!

We want the computer to be random sometimes!

Using the random module

Let's choose something randomly from a list!

This is like drawing something out of a hat in a raffle!

We use **random.choice** to randomly select something from a list

```
import random
shopping_list = ["eggs", "bread", "apples", "milk"]
random.choice(shopping_list)
```

Each time we run this we would probably get a different answer

eggs OR bread OR apples OR milk

Using the random module

You can also assign your random choice to a variable and then use that variable in your code

```
import random
shopping_list = ["eggs", "bread", "apples", "milk"]
random_food = random.choice(shopping_list)
print(random_food)
```

The variable **random_food** contains the random choice that was made from the list

Project Time!

Raaaaaaaaandom! Can you handle that?

Let's put what we learnt into our project

Try to do Part 5

The tutors will be around to help!

While Loops

Loops

We know how to do things on repeat!

Sometimes we want to do some code on repeat!

Infinite loop!

Sometimes we want our loop to go forever!

So we set a condition that is always True!

We can even just write True!

```
while True:  
    print("Are we there yet?")
```

Infinite loop!

Sometimes we want our loop to go forever!

So we set a condition that is always True!

We can even just write True!

```
while True:  
    print("Are we there yet?")
```

```
Are we there yet?  
Are we there yet?  
Are we there yet?  
Are we there yet?  
Are we there yet?  
Are we there yet?  
Are we there yet?
```

Introducing ... while loops!

```
while True:  
    print("Are we there yet?")
```

Loop condition

Indent!

Code to repeat

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

Guess a number:

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

```
Guess a number: 5
```

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

```
Guess a number: 5  
Guess a number:
```

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

```
Guess a number: 5  
Guess a number: 100
```

Give me a break!

But what if I want to get out of a loop early?

That's when we use the **break** keyword!

```
while True :  
    number = input("Guess a number: ")  
  
    if number == "42":  
        print("You got it right!")  
        break
```

```
Guess a number: 5  
Guess a number: 100  
Guess a number:
```

Give me a break!
